

Mission Statement, and business objectives

Mission Statement:

“To provide transparent, capability driven governance for the agentic era, ensuring agentic AI remains an asset, and not a liability.”

Business Plan:

1. The Problem: The Agentic Governance Gap

Current security layers (CASB, EDR, SWG) are blind to “Shadow AI” agents that run locally. Developers are deploying tools that can autonomously execute shell commands and modify files, often without any cloud-side visibility or footprint.

2. The Solution: Multi-Dimensional Detection

Detec provides an endpoint agent designed to classify AI tools by capability class, (A-D) rather than product name.

- **Evidence Based:** Scores attribution across five layers- Process, File, Network, Identity, and Behavior.
- **Explainable Governance:** Every action is tied to a deterministic, versioned rule ID for full auditability.

3. Target Market & Ideal Customer Profile (ICP)

- **Primary Segment:** Small teams, and Mid-to-large enterprise firms, and highly regulated industries.
- **Buyer Persona:** The CISO, IT Director, or Head of DevSecOps who need to allow AI for productivity, but must satisfy compliance/governance requirements.

4. Competitive Advantage (The “Moat”)

- **Behavioral Fingerprinting:** Detec identifies 8 specific agentic patterns (shell fan-out, R/M/W loops, etc) that catch even renamed, or custom-forked tools.
- **Integrity Transparency:** Unlike "black box" security tools, Detec documents its known limits and evasion vectors to build trust with technical stakeholders.
- **Low Friction Deployment:** Ships as a standard OS service (Windows, macOS) with SIEM-ready JSON output.

5. Revenue Model

- **Tiered Subscription:** Per-endpoint monthly pricing.
- **Visibility (Free):** Detect and monitor state.
- **Governance (Premium):** Hard-blocking, Approval-required gates, and EDR delegation.

6. Traction & Validation

- **Technical Maturity:** 400+ automated tests and 10+ lab-validation runs across 7 of the most highly-used AI tools.
- **Performance:** Implements changes-only reporting and exponential-backoff to minimize system and network impact.
